# Persona Switcher Compatibility with Personal Menu Extension

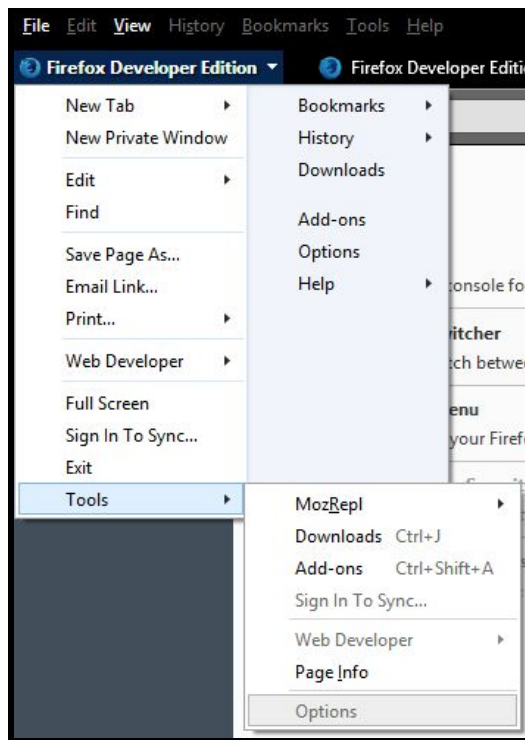

Substantial testing was done for the compatibility of Personal Menu extension with Persona Switcher. As far as functionality, we are only able to add the Persona Switcher main menu and the Persona Switcher menu from the tools menu. We are not able to add the toolbar button menu. Persona Switcher does seem to be compatible with Personal Menu extension and there are no major concerns. The following list a few findings that were found through testing:

← This image shows the Persona Switcher main menu if we add it to the Personal Menu.
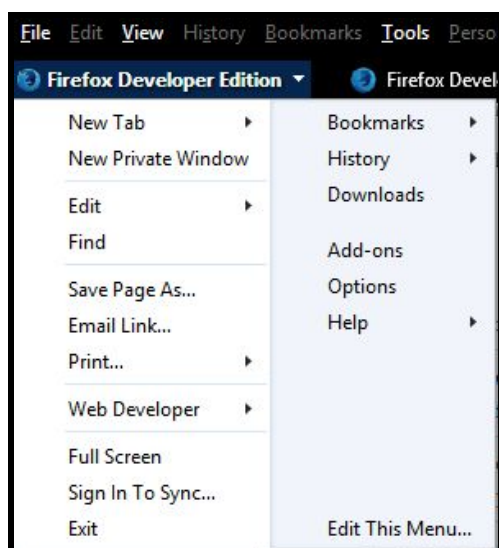

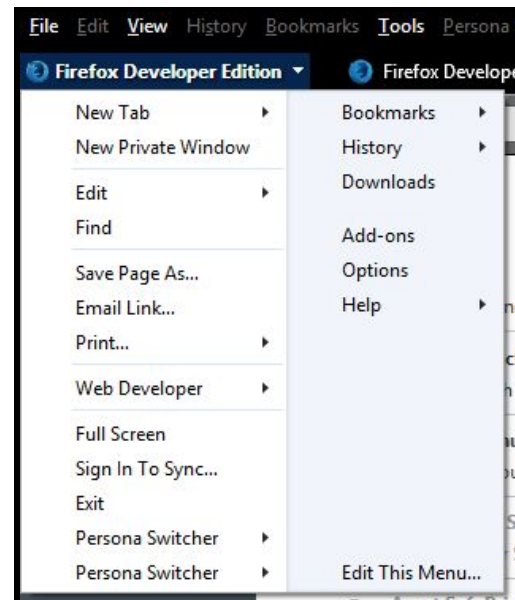

This image shows the Persona Switcher menu in the Firefox tools, when it's → added to the Personal Menu.

← However, if we disable either menu in the Persona Switcher preferences, they also become disabled in the Personal Menu. If you look at this image, it show that neither of the two menus show up.

Personal Menu also allows the option to add "subfolders" or "submenus" to the menu. In this image, you can see that the Persona Switcher main menu is added, as well as the → submenu of Persona Switcher from the tools menu. The problem here is that both menus are displayed with the same name and doesn't really give us a way to distinguish them.

← The image here displays the Persona Switcher main menu and the Persona Switcher tools submenu as disabled.
